HACKATHON PITCH

Collab Desk

Make every brand inquiry a better deal.

CREATOR × BRAND WORKFLOW

Attraction → Motion → Transformation

A creator-first desk for turning inbound emails into clear, reviewable partnership decisions.

THE HOOK

₹8,000 for a reel?

The offer looks simple. The terms around it are not.

CAFE RAMWADI · DEMO

Offer

₹8,000

Creator reel rate

₹15,000

One email can hide a ₹7,000 gap before you even discuss usage.

A concrete demo case from the project fixtures—not a market statistic.

THE GAP

A brand email starts a workflow, not a partnership

Creators still have to turn scattered details into decisions and follow-ups.

01

INQUIRIES

Terms arrive in free-form messages.

02

DECISIONS

Budget, deliverables and usage are easy to miss.

03

FOLLOW-THROUGH

Replies and payment follow-ups compete with making content.

The opportunity: make the business side feel as manageable as the creative side.

CREATOR PROFILE

Aanya’s workspace gives every deal useful context

The demo is configured for one Pune-based food and city-life creator.

AK

Aanya Kulkarni

@aanya.eats.pune · Pune

48,000 FOLLOWERS

RATE CARD

REEL	₹15,000
POST	₹8,000
STORIES	₹4,000

CREATOR GUARDRAILS

No competing café in the same month · 30-day usage included · Longer usage adds 40%

THE MANUAL GAP

Email gives you the conversation, but not the whole workflow

CollabDesk organizes the details that the creator must evaluate and track.

EMAIL-ONLY FLOW

- Re-read the thread to find terms
- Recall the right rate and usage rule
- Draft each response from scratch
- Remember which deal needs follow-up

COLLABDESK PROTOTYPE

- Extract a structured deal record
- Compare offer with saved rate rules
- Draft a reply for creator review
- Keep basic deal stages and next actions visible

Workflow comparison only. This is not a competitor study or measured time-saving claim.

PRODUCT IDEA

Attraction → Motion → Transformation

One desk that helps creators find fit, move faster, and protect the value of each deal.

01

ATTRACT

Find the right fit

Use creator context and content patterns to focus on partnerships that make sense.

02

MOTION

Move the deal forward

Turn an email into a deal card, compare the offer with the rate card, draft a reply.

03

TRANSFORMATION

Build a better business

Keep terms, status and follow-ups visible so creators can make deliberate choices.

WORKSPACE MAP

Five views keep the creator’s work in one place

Each view serves one step in the creator-brand collaboration cycle.

01 TODAY

Next actions, deal counts and follow-ups.

02 INBOX

Paste a brand email and extract its terms.

03 DEALS

Track offers through paid and posted stages.

04 CONTENT

Review reach and saves from workspace data.

05 MEDIA KIT

Maintain creator niche, audience and rates.

WHAT WORKS TODAY

A small prototype with a complete deal loop

The demo follows an inquiry through parsing, pricing, reply drafting and follow-up.

01	**Capture**	Paste an email into the inbox.
02	**Structure**	Extract brand, budget, terms and deadline.
03	**Decide**	Compare offer to the creator’s rate and usage rules.
04	**Respond**	Draft accept, counter, decline or clarification.
05	**Track**	Move the deal through new, negotiating, posted and paid.

Content insights and a bounded “Ask your desk” assistant add context to the next decision.

DEMO MOMENT

From a messy inbox to a clear counter

Example from the prototype: Café Ramwadi offers ₹8,000 for one reel and two stories.

INBOUND EMAIL

**“We love your Pune food reels.
One reel + 2 stories.
Budget ₹8,000. Post this week.
30 days of usage.”**

Café Ramwadi

DEAL CARD

Café Ramwadi

PAID COLLAB · REEL

₹8,000 offer

Creator reel rate: ₹15,000

30-day usage included

NEXT STEP

Counter with context

Draft a reply.
Review and edit.
Copy when ready.

A useful decision aid—not an auto-send bot.

RATE AND USAGE LOGIC

A transparent quote explains why an offer is flagged

The creator’s rate card stays the source of truth; the prototype makes the comparison visible.

01 FORMAT RATE

Start with the creator’s rate for the deal format.

REEL · ₹15,000

02 USAGE WINDOW

More than 30 days adds 40% to the suggested fee.

31+ DAYS · +40%

03 LOWBALL FLAG

Flag an offer below 70% of the suggested fee.

₹15,000 × 70% = ₹10,500

EXAMPLE **Café Ramwadi’s ₹8,000 offer is below the ₹10,500 flag threshold for a ₹15,000 reel rate.**

The quote uses format + usage rules; it does not automatically add every listed deliverable.

AI AND AUTOMATION

AI reads and drafts; code controls the fee

Optional model calls never decide or change the creator’s rates.

INBOX EXTRACTION

Email text → OpenAI optional gpt-4o-mini → Validated deal fields

REPLY DRAFT

Intent + deal + fixed quote → OpenAI optional gpt-4o-mini → Subject + reply body

VALIDATION + FALLBACK

Model JSON is checked. Missing key, timeout, provider error or invalid output falls back to deterministic code.

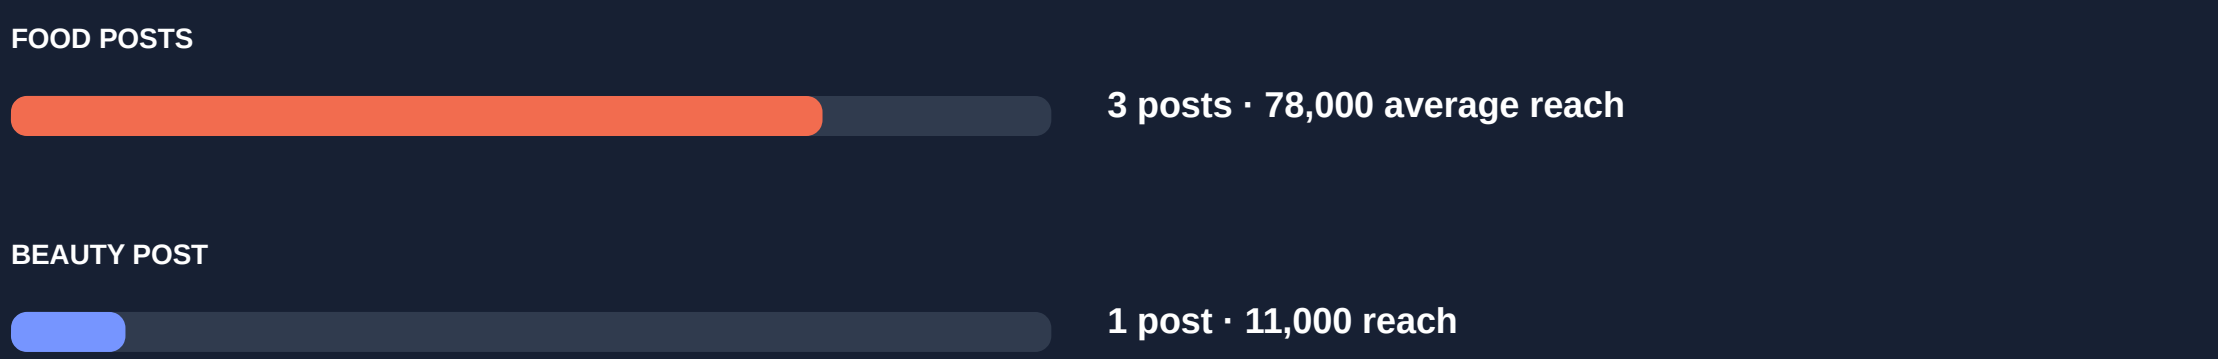

Rate quote remains deterministic in server/rate.js.

CONTENT CONTEXT

Use past performance to shape a better-fit brief

Demo post data gives the creator a starting point for partnership conversations.

AVERAGE REACH IN SEEDED DEMO DATA

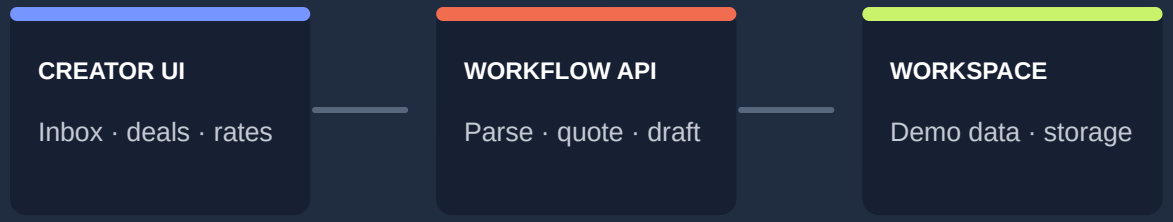

Directional signal only: posts are fixtures in the prototype, not live platform analytics.

HOW IT IS BUILT

Simple rules for the decision; AI for the busywork

A human stays in control of every business decision and outgoing message.

Optional model assistance

Rate and usage rules stay deterministic.

CURRENT BOUNDARIES

- No login or multi-creator isolation
- No live social account or analytics connection
- No automatic email sending or invoicing

Trust starts with clear limits and creator review.

STATE AND STORAGE

A small state document keeps the prototype clear

The schema fits one demo creator today; multi-creator ownership needs a redesign.

creator

profile · niche
followers · rates

deals[]

brand · offer · terms
status · usage

posts[]

topic · reach
saves · format

DEFAULT

server/data/db.json

OPTIONAL

Supabase · one collabdesk_state JSONB row

Quotes and reach averages are computed when requested; no normalized tables or foreign keys exist.

ENGINEERING CHOICES

Small safeguards make a local demo more reliable

They improve bounded input handling and writes; they do not replace identity or access control.

BOUNDED REQUESTS

16 KB API body cap · email up to 10,000 characters · field validation

RELIABLE FILE WRITES

In-process update queue · temp write + atomic rename

OPTIONAL DATABASE

Supabase compare-and-swap revision check · retries up to five times

LOCAL-ONLY DEFAULT

Bind to 127.0.0.1 · exact-origin CORS allowlist

No authentication, authorization or per-user boundaries exist. Do not expose this API to a shared network.

EVIDENCE TODAY

The API suite passes; user impact is still a hypothesis

Verification covers backend behavior and a production frontend build, not a browser journey.

10 / 10

automated tests pass

API · validation · fallback · rate logic · mocked Supabase

BUILD

Vite production build passes

Frontend assets compile successfully.

NOT VERIFIED

No live OpenAI or Supabase check

No automated browser, accessibility, responsive or user study results.

No time-saved, revenue or adoption claims are available yet.

HACKATHON ASK

Help us validate the workflow with real creators

The next milestone is learning whether the desk saves effort and improves deal clarity.

WHAT WE WANT TO LEARN

Can creators act on an offer faster—and feel clearer about the terms?

We want feedback from creators and a few brands on the inbox-to-reply flow.

NEXT BUILD

1. **Secure creator accounts and private workspaces**
2. **Connect real social metrics with creator permission**
3. **Test rate and usage decisions with pilot users**

CollabDesk

Make the business side easier to manage.

WHAT WE WILL VALIDATE

A useful desk should make the next decision clearer

We want to test the workflow with creators before expanding integrations.

1	TIME	**Email received → reply reviewed**
2	QUALITY	**Key terms extracted correctly**
3	CONFIDENCE	**Creator agrees with the rate and usage flag**
4	FOLLOW-THROUGH	**Next action completed on time**

OUR ASK **Creator pilot partners + feedback on the inbox-to-reply experience.**

API BACKUP

Twelve endpoint actions support the current workspace

The Vercel-style adapters are present; a deployed endpoint was not verified.

PROFILE + DEALS

- GET /api/creator
- PUT /api/creator
- GET /api/deals
- GET /api/deals/:id
- PATCH /api/deals/:id

INBOX + REPLIES

- GET /api/samples
- POST /api/inbox/parse
- POST /api/deals/:id/rate
- POST /api/deals/:id/reply

INSIGHTS + ASSISTANT

- GET /api/content
- GET /api/today
- POST /api/assistant

All API routes are shared single-user demo routes. No auth middleware or owner scoping.

CODE MAP BACKUP

Find implementation fast during judge Q&A

The active React/API workflow is separate from an unused TypeScript engine module.

UI + browser API	**src/App.jsx · src/api.js · src/main.jsx**
API routes + validation	**server/index.js · server/prompts.js · server/rate.js**
Persistence	**server/store.js · server/supabase-store.js · supabase/migrations/**
Fixtures + checks	**server/data/db.json · server/samples.js · test/**
Prototype logic	**src/lib/collab/engine.ts and types.ts are not imported by the active UI**

A live feature is one connected through the current frontend/API path—not merely a definition in an unused file.
